No Site objects getting created

Posted by SecondhandBuddah - 2010/04/28 22:41

Hi
In my installation of JMS 1.2, when I do an install (single database with shared tables), The site folder gets created, and config_multisites.php gets written there - but that's the only file in the folder?
There are no created directories or symbolic links (the site is hosted on Linux and symbolic links are enabled).
The database table creation works well. All of the relevant tables seem to be there. JMS returns no errors during the installation and it looks like worked correctly - except there are no files folders or sym links?

Could you possibly point me in the right direction?

Thanks,
Robin

If your slave site is working correctly, this may due to the tool that you are using and that hide the symbolic links.
In this case, you think they are not present but in fact they are just hidden.

Use an FTP tool that display the symbolic link or better, use a SSH terminal to check physically the directories and symbolic links.

Hi Edwin,

Sorry this was my own stupid fault. I closed one of the {site_id} tags with a) in my template.

Thanks for the prompt response.

Regards,
Robin
