Expiration URL not working

Posted by DaveC - 2010/07/16 15:06

Hello

I do have quota...

I have the Expiration URL: set to a known good URL. When I set the Expiration date: to the date earlier then today the site goes offline but instead of the redirection page it goes back to the home page instead of the Expiration url as set.

Would you have any tips for troubleshooting this issue?

Thanks
Dave

Hi Edwin

Have you had any luck reproducing this bug?

Thanks
Dave

When you modify the date to set it with an older value, this result is to remove the slave site from the Multisites index like when a website is not confirmed (ie. cancelled).
In this case, the processing performed by JMS Multisites fails and it uses the "configuration.php" located in the current directory.
When you have deployed the slave site into a specific directory, this is the slave site configuration that

may explain that you see the slave site.

If you don't set the date manually to an older date, the information remains in the Multisites index and in this case the expiration is processed.

I will try to see if I could keep in the Multisites index the expired slave site and not remove them from the list of slave sites. In fact, I remove the older slave site speed-up the processing.

_____

I have improved the processing to now save the expiration information event when it is expired and keep the expiration url to redirect the user to the appropriate expiration url.
This will be available in next JMS multisites version 1.2.35

_____

FYI -- You can not save a NON SEF url in the expired url field.
