Site Login
Posted by vinod - 2011/04/05 19:27

Hi edwin,

I have register in master site and created the slave site from front end,but i can not share the master site with newly created slave site user.how to share the user with master site.

Share the users between website is something decided when you create the slave site.
This operation change the way that the slave site DB is created.
See the tutorial video 16 that show how to share the users and extensions between websites.
Rather than sharing the "slave1" website, you can change the rule to select the "master DB" instead of the "slave1".

Hi Edwin,

When I logged in into the slave1,slave2 also logged in automatically.how to solve this?
and I have created the slave sites from front end and listed under particular menu item link while clicking that how to redirect to slave site and it should not ask there to login again because we have already logged in master site.

Please assist me how to acheive this....

If slave1 and slave2 are websites with subdomain or subdirectories and that you have shared the users, this is normal that you benefit of the single sign-in.

If the slave1 and slave2 are defined on different domain name then you do not benefit of the single sign-in.

So if you share the users, you have to verify the domain name used by each slave site and if they are on the same domain, you can benefit of the single sign-in. Otherwise, you need to re-login with the same login and password.

Slave1 and slave2 will be an subdomains

is there any way to restrict to login both sites.

If the slaves are subdomain and that you don't want to have a single sign-in, you have to keep the user totally independent and no shared as you seems to do it.

So in the JMS Template rule, do not share the user or extension that also require to share the users.

Hi Edwin,

is it possible to share the uddeIM Mailbox module? It shows the following error message
Risk to define this extension,Tables to replicate not defined in jms.

Concerning you login problem, you have to describe in detail the definition of your slave sites.
Do you share the users ?
How did you created the slave sites ?
Which are the domains name of the slave sites ?
Do you use subdomain, domain or subdirectories ?

Which version of Joomla ?
Which version of Jms Multi Sites ?
Did you install all the patches ?
....

_____

(4) If all the websites are defined in a subdirectory, I don't see.
Check if you have a "cookie_domain" defined when you go in the Joomla help / php information.

I suspect that the problem comes from the "master.site.us" that is not on the same domain as "mastersite.com".
If you have the "site.us" domain defined in the "cookie_domain", this mean that only this website can access the website.

If you can not login to see the PHP information, just copy a test.php file with the phpinfo().

_____

Hi Edwin,

Yes, It shows session.cookie_domain = novalue

How to set the value?

==========

Re: Site Login
Posted by edwin2win - 2011/04/19 16:52

_____

Don't change the cookie_domain.
When it has "novalue" this mean that you should be able to login.

If you are not able to login, this probably mean that there is something else but I don't see it.

If you want that I have a look on your environment, this is possible with our billable support that you can order at
