# Article Sharing isn't working correctly.

Posted by silverthread - 2012/02/24 04:42

---

I have the Article Sharing plugin installed, and wish to update the articles on my slave sites from the master site.

When I use the Tools and go to com_content and click "propagate to children" and "overwrite," then hit execute, I get the following error:

Install component 'root' menu error query . DB Error: Table 'moreinc_slave1.slave1_components' doesn't exist SQL=REPLACE INTO slave1_components VALUES( 0, 'Multi Sites Articles sharing', 'option=com_multisitescontent', 0, 0, 'option=com_multisitescontent', 'Multi Sites Articles sharing', 'com_multisitescontent', 0, 'components/com_multisitescontent/images/multisitescontent_icon.gif', 0, '', 1 )

Could you please help me understand why this isn't working? I see green check marks next to the child databases, but the master db has a red X icon, and the above error message. When I visit the slave sites, the articles have not updated.

My browser's cache has been cleared.

Any insight you can provide is greatly appreciated.

Matt

I think that you make confision between the "Article Sharing for JMS" extension and the functionality that consists in the JMS tool to overwrite the content of an extension.

The "Article Sharing for JMS" does NOT own any content.
The content is the joomla article content and the "Article Sharing for JMS" directly read the other DB to get the articles.
So you can use the "overwrite" functionality for the "Article Sharing for JMS" as there is not content to update.

On which Joomla version do you have this error message reported ?
Do you have that with Joomla 1.5 or 1.7 or 2.5 ?

I suppose that you are working on Joomla 1.5.
