Can each slave site's admin manage template ?

Posted by mybes1@gmail.com - 2013/07/12 13:07

---

hi,

Q1 :
My concern is whether the slave site can have separated Administrator to manage and select and design the website template on their own ? OR it has to be done and select the template layout by MASTER site superadmin only ?

I want all my slave sites to have individual administrator and they can login and select their own template. Can it be done ?

Q2 :
Can I install independent Modules or component on selected slave sites only ? Or it has to be installed on MASTER site and then activated it on selected slave sites ?

thanks

Q1) By default each slave site have their own admin.
You need to share the user to have the same admin.
With the "Partial User Sharing", it is possible to share the user and also provide different permission.
https://www.jms2win.com/en/joomla-multisite?page=shop.product_details&flypage=flypage_multisites.tpl&product_id=63&category_id=1

If you want that each slave site have the possibility to install their own template, this is also possible. You need to setup the slave site with the template folder = {deploy_dir}/templates

See also tutorial video 0.b slide 31-34

Q2) NO.
The concept of JMS is based on the sharing.
Sharing of the PHP code with the master
Sharing of the content of a limited number of extensions.

Each module, component, ... (extensions) must be installed in the master before to re-install (or use them) into a slave site.

So you have to install everything in the master and after decide which one you want to use in a slave.
This can be done with the JMS tool menu or with the re-installation of the extension from a slave site.
