Wrong Database

Posted by alkemdlt - 2019/12/11 09:25

Hi, I have created a slave site with new database and checked all the config files are pointed to the slave database. However when I login to administrator page, the global configuration shows the master database. I am unable to change directly due to permission settings. Is there any other option which I could change to point to the correct database? Oddly the user page shows details from the slave database.

Solved. Reinstalled and clear browser cache.
