

Change the domain list delete all my changes

Posted by wedeen - 2013/04/22 15:50

Hello,

I had one Master Site and a few Slave Sites, that I created with a template. All Slaves based on a Default-Slave Site, that I had created before - this is empty (categories but no Items) and I filled it later.

On one Slave I had to change the Domain list and after saving this changes, my changes at the Menustructure are gone (again the same as the default-slave), but the items are there.

My English is not so good, I hope you understand what I mean.

Is this a bug? How can I prevent that the database of my slave sites are changed if I made changes in the "Manage sites" of Multi Sites?

Greetings, Verena

Your question is not easy to understand.

When you go in the "Manage Site" and edit a slave site definition, when you save the definition, this applies again the "JMS template rule" that you have selected.

Therefore, when new extensions or tables are detected based on the template then the slave site DB is also updated. If you don't want to update the DB content of your slave site, you need to change the JMS template rule to use a "fresh slave" without any DB defined.
