API Plugin onDeploy_OK

Posted by buddyq - 2013/06/07 18:34

I am writing a plugin that I am triggering for onDeploy_OK. I am trying to use either JFile::copy() or just copy() to transfer the users profile image to a folder of the new site they created but the file doesn't exist yet.

```
$fileLives = JFile::exists($profile_dest);
 if(!$fileLives){
  return JError::raiseWarning( 500, JText::_('File does not exist '. $enteredvalues) );
  }else{
   JError::raiseWarning( 500, JText::_('IT DID EXIST '. $enteredvalues) );
  }
```

The result is always false so I'm wondering if this function fires AFTER the files are all copied over? Or is there another way? I even tried renaming the function to someting else like doFileCopy(&$enteredvalues) and then calling it under

$this->_onDeploy_OK($enteredvalues); near the bottom of saveSlave() inside

components/com_multisites/views/slaves/view.php hoping it would trigger AFTER files are moved but still get the same result. How can I run this code AFTER I know the files have been transferred?

==========

What is the $profile_dest ?

When a slave site is deployed, you can retreive all its informations with the MultisitesUtils::getSiteInfo( )

So if you know the site ID, you can retreive the detailed info on the site and therefore its deploy_dir (the deployed directory).
