Customs extensions features support

Posted by Ramu - 2014/08/08 06:16

Hi

how to use custom component in the master and slave site, in my old website i am using custom component(like as.. jobs,blog,support and profile) or now i want to use here also, so my question is, how to use custom component with the jms multisite and jms multisite will except this features and this features compatiable with jms multisite extensions.

When an extension is not defined in the JMS tools, a possiblity to install the extension in the slave sites consists in re-installing your custom extension into the slave site to let your extension create the MySQL tables required by your extension.

Another possiblity is to duplicate (copy) a website that already contain the extension "pre-installed". So that, the tables will be copied.

Another solution is to develop a specific plugin to declare in JMS the definition of your specific "custom extension". So that you could have its definition added into the JMS tool menu.

Can we not install customs extensions in the master site.

and second thing which you are saying like copy a website it means copy normal website or jms multisite website or if there is providing any copy option by the jms multisite.

Could you help me to clear this thing.

You always need to install the extension in the master to have the "PHP code" installed.

In the slave site, the only think that is required is the MySQL tables for this extension.

This explain that a plugin should be created to describe the MySQL tables used by the extension. When we say duplicate (copy) a website, this mean copy all the MySQL tables used by site website. So as you copy ALL the tables, this includes the tables required by the custom extension.

I hope this is more clear
