get rid of /multisites/{siteid}/config_multisites

Posted by brunet - 2014/09/12 11:46

Hi,

I'd like to get rid of /multisites/{siteid}/config_multisites.php
I'm looking everywhere in the code to find out where it's loaded, and even if i found 4 or 5 files in which it seems to be used and try to override their behaviours, each time i rename the file for one site, it breaks the website and redirect to joomla installation.
I really need to hack this for personal reasons, and would love to figure out where and how it is used !

Thx

If you want to put the /multisites directory in another place, you need to change this path in the JMS settings menu.

When done, you could move the /multisites directory to the new place but becarefull to update each slave sites because the path is stored in few places.
