Domain mirroring within the JMS Multisite environm

Posted by azurelink - 2018/02/07 23:39

Hi Edwin --

I have an interesting problem.
I have a new domain: outsidedomain.com
on our VPS server which I want to mirror the content of one of our JMS slave sites: slave1.com

I've parked outsidedomain.com on top of slave1.masteracount.com in WHM.

It displays the content of the slave1.com site, but it also changes the URL to the slave1.com domain name.

I would like it to stay as http://www.outsidedomain.com.

How do I make this work.

Btw, I put a blank test.html file into the slave1.com public_html diretory and it does display correctly with the outsidedomain.com in the URL.

Thanks.

Parked domain in WHM, consist in creating an alias on the "/public_html".
If you have created a slave site "slave1.masteraccount.com" that follow are recommendation then this slave site is located in /domains/masteraccount.com/subdomains/slave1/public_html.

Therefore the usage of the WHM Alias will fails as the document is wrong.
You probably have to create an AddOn domains that provide the same "document root" as the "slave1.masterdomain.com".
So that both the outsidedomain.com AND the slave1.masterdomain.com will point to the same place.

In addition of that, when the WHM (mean apache) is pointing to the correct "document root" then you can update you JMS manage / site definition to update the existing Site ID to add the additional outsidedomain.com as synonym of the "slave1.masterdomain.com".

Also becareful in the case where you would have enable the "redirect to first domain" flag because in this case, the "outsidedomain.com" will be redirected to the first one.
So if the flag is enabled and if you still want to have "partial" redirection then you will have to create a custom ".htaccess" to create the specific redirection rule.
