I have setup a replica Master Subdomain.

When it loads using index.php i get the error '404 Page not found' but when i do not load the index.php the page loads fine.

I can see that the index.php file redirects to the main index file which in turn calls defines.php. I have not edited either the index or defines files.

I cannot find why the slave site will not load the index.php as the primary site does. Any help would be appreciated.

Thanks
