AutoTweet NG Pro support ?

Posted by canadareic - 2012/10/24 02:07

Hello Edwin

Would you like to answer to developer from extly.com who is developing new component AutoTweet NG Pro. They would like to support jms2win within their component

1. Please, send the error description:
PHP Fatal error: Class 'CommunityIndex.phpController' not found in /home/******/subdomains/master/public_html/components/com_community/community.php on line 167
PHP Warning: Invalid argument supplied for foreach() in /home/******/subdomains/master/public_html/libraries/joomla/string/string.php on line 970
PHP Fatal error: Class 'CommunityIndex.phpController' not found in /home/******/subdomains/master/public_html/components/com_community/community.php on line 167

2. How a JomSocial plugin must include the JomSocial Library API?
For example, plugins/community/walls/walls.php includes the JomSocial API in the same way. Please, send us the file to check if it's modified.
Thanks,

I will appreciate your support in this matter.

---

1) Perhaps that your develop work with Joomla 3.0

In joomla 3.0 the "JController" is no more a class.
He has to use the "JControllerLegacy".

This is also a change between Joomla 2.5.6 and 2.5.7 that consists in using the JControllerLegacy instead of JController.

Another possible reason is that you have ".php" inside the class name.
So the developper probably didn't provided the correct instance name.
Perhaps he used basename() function without specifying to ignore the '.php'

2) You always have to use the standard joomla JPATH_XXXX
ie. JPATH_SITE, JPATH_LIBRARIES, ...

---

please do not kill the messanger
reply I'm sorry, the answer is not clear.

We are only including JomSocial API in this way:

require_once JPATH_ROOT . DS . 'components' . DS . 'com_community' . DS . 'libraries' . DS . 'core.php';

And you get an error 500 in the screen.

PHP Fatal error: Class 'CommunityIndex.phpController' not found in /home/canadare/subdomains/master/public_html/components/com_community/community.php on line 167
PHP Warning: Invalid argument supplied for foreach() in /home/canadare/subdomains/master/public_html/libraries/joomla/string/string.php on line 970
PHP Fatal error: Class 'CommunityIndex.phpController' not found in /home/canadare/subdomains/master/public_html/components/com_community/community.php on line 167

Please, attach a screenshot to the forum post, and this detail.

Thanks,

When you have a look in the source /components/com_community/community.php on line 167
you can see that the class name is computed in a variable $viewController and this value seems incorrect.

It is computed based on JomSocial $config that seems to have the value "index.php"

So report this error to JomSocial or the author of "AutoTweet".

Edwin

At this stage we got reply from another developer

We've tested again. The problem seems to be in this line:
require_once JPATH_ROOT . DS . 'plugins' . DS . 'user' . DS . 'autotweetsocialsubmit' . DS . 'autotweetsocialsubmit.php';
The previous line works Ok:
require_once JPATH_ROOT . DS . 'components' . DS . 'com_community' . DS . 'libraries' . DS . 'core.php';
We've tried to hardcode '/home/canadare/subdomains/master/public_html/plugins/user/autotweetsocialsubmit'. But it does not work.
Do you know which is the right path for Jms2Win to find the plugin?
Thanks,

==========

Re:AutoTweet NG Pro support ?

I think that you can not hardcode the physcial path because some code could check that it is part of the JPATH_ROOT of joomla.
This is the case in Joomla 2.5 that at different places, check the path.

You need to use the JPATH_ROOT to compute the path.

The original problem describe report an error on the class name and not on the file that is not included. You should better have a look how the class name is computed to understand why the "index.php" is added in the class name.

Now comes very sad answer from developer

Hi Jarek,

It is implemented with JPATH_ROOT... but it's not working with Jms2Win.

I'm sorry, we've exhausted all possible solutions.

In future, if we have an opportunity to debug a project with Jms2Win, we'll give it a second try.

PD: The ticket is marked as solved, but it will remain open for 2/3 days until we receive your feedback.

Thanks,

Is there a way to support this component as many other components are supported by jms2win? I can provide component

I would ask what are the chances to to support AutoTweet NG Pro by jms2win?

==========

Re:AutoTweet NG Pro support ?

Posted by edwin2win - 2012/11/22 17:32

JPATH_ROOT is defined at the startup of Joomla.
If the extension bypass the joomla installation, this might explain that the JPATH_ROOT would not be defined.

If you want that we debug the AutoTweet extension in your environment, this is possible with out billable support that you can order at
http://www.jms2win.com/en/joomla-multisite?page=shop.product_details&flypage=flypage_multisites.tpl&product_id=35&category_id=1

---

can I please have quote?

==========

Re:AutoTweet NG Pro support ?

Posted by edwin2win - 2012/12/05 12:24

I am not able to give you a quote to debut this AutoTweet extension and identifying where it fails.
If the debugging can be done in your environment and perhaps we could add a trace in the "AutoTweet" in 1hour to identifying the case where the JPATH_ROOT has a wrong value.

==========

Re:AutoTweet NG Pro support ?

Posted by edwin2win - 2013/01/07 21:51

The problem is due to conflict between several extensions that include a library called 'tmhOAuth" to manage twitter.

You can find such library present in component such as autotweet, MyBlog, obsocialsubmit,
or plugins obss_extern, techjoomlaAPI

So when several extension contain the same library that is included twice, this cause a PHP fatal error due to class already defined.
