MijoShop in Slavesite produces wrong paths for JS

Posted by iage - 2013/10/08 16:02

Hello,

I installed the latest version of MijoShop (2.1.6) and JMS recognizes it and offers to share the component with slave sites.

However, in the Slave-Backend, the Dashboard is not displayed correctly (no MijoShop-Menu) and in the Slave-Frontend it creates absolute paths for javascript-files, including Document Root in the path.

How can I fix this?

Do you have a support-/ticket-system where I can send the login-data so you can have a look?

Kind regards

-Stephan

If you want that I have a look on your environment, this is possible with our billable support that you can order at
https://www.jms2win.com/en/joomla-multisite?page=shop.product_details&flypage=flypage_multisites.tpl&product_id=35&category_id=1

In this case, we work with skype for the chat and phone.
We also use teamviewer to share our desktop during the support session that we do with you online.
