Slave site uses master's configuration file

Posted by toshiko - 2014/09/11 08:47

Joomla! 3.3.3
MultiSites Version 1.3.33, patches installed

Hi,

I created a slave site using the replicMasterSubdir template (with separate database).

The problem: the slave site uses the master configuration.php file, not the configuration file from the slave subdirectory.

Would you have an idea how I can set the slave site to write on it's configuration file, not on the master's?

Aditional Info:
- If I edit Global Configuration of the slave site with the database details and it's log and tmp paths, it automatically changes the master Global Configuration also, meaning that they use the same configuration file.
- I also have another slave site, created a few months back, that is working fine and uses it's own configuration file.

==========

Re:Slave site uses master's configuration file

Could anyone help with my issue, please?

Does this configuration file issue have anything to do with the symbolic links, and if it does, how can I fix it?

Or should I change some code in the multisite php files?

Thanks

If a slave site use the master configuration.php, this can be either due to:
- mispelling the domain name (case sensitive) or missing www and without www domain name
- error when saving the slave site definition. You need to have a success (blue or green message) depending on the joomla version

When you create a slave using the "replicMasterSubdir", the configuration.php is normally stored in the subdirectory.

So if the slave site ID = slave1
then you URL is http://www./slave1
and the configuration.php is located in the /slave1/configuration.php

If you don't have the configuration.php file in the slave1 directory, this could be due to an error in saving the slave site.

You must have the symbolic link functionalities allowed and you should have plenty of symbolic link created in the /slave1 directory

slave1 is a sample.

There is no change to do in multisite php file.
You probably had an error message.

_____

Thanks edwin2win,

the url is correct and everything looked fine apparently, until I checked the configuration file, which has the master's details.

My slave site url is www.master.com/slave1 and it's configuration file is located in /slave1/configuration.php. This configuration file has all the correct slave site details.

I will check one more time considering your suggestions, maybe I missed something.
