Feature request.

Posted by KingoftheRoad - 2009/03/26 13:36

I post feature request here because I cannot find anywhere to post.

1. "admin password confirmation" on front end website creation page.

2. as JMS cannot create deployment folder itself, we need to create all those folders beforehand. However, there are no "keyword" which can create those folders in sequence, such as /home/website01, /home/website02,,,,,,etc. We need some new "keyword++" to allow us create those directory behorehand to make the system fully automatic..

Thanks.

As you don't know where to post this message, I have moved it into the forum relatives to the requirement.

Concerning point 1, I have noticed.

Point 2, you can already perform such additional website creation when you use the "billable website" functionality.
In this case, you could add in the "Payment Script" present in the menu type "Multi Sites" the mkdir required to create the directory.
This script is called before the website creation.
See User Manual chapter 4.2
