localhost configuration
Posted by john@phortse.com - 2009/01/20 15:27

I set up a slave site using http://production-domain.com/{site_id}. I use localhost to configure/update/test and then I push the changes with JoomlaPack to the production domain. How do I configure JMS to work on my localhost (xampp) and migrate seamlessly to my production-domain.com using JoomlaPack?

JMS 1.1
Joomla! 1.5.9
JoomlaPack 2.0.1

JMS is designed to work with domain, sub-domain and sub-directories.
It is not designed to work with localhost.

---

but you can add your domains to etc/host to work on localhost

example

127.0.0.1 localhost
127.0.0.1 www.yourdomain.com
127.0.0.1 www.yourdomain2.com

and create the virtual hosts for those domains in your server

It´s a way to work with JMS on localhost.

Goodluck

Thank you for this new idea.

Here it is the procedure that I have published when working on a localhost and if you want to simulate any slave site.
