Media & Image folder

Posted by KingoftheRoad - 2009/03/17 16:24

The configuration of my manually created slave site is:

Master Site Directory:

/home/joomla/joomla_1.5.9

Deployed directory:

/home/joomla/web06

at the Global Configuration of the Slave Site administration:

I can config:

1) path to log folder: /home/joomla/web06/logs;

2) path to tmp-folder: /home/joomla/web06/tmp

However, I'm not able to change the Image & Media folder to the deployed directory , they are fixed at images & images/stories, When I check the Media Manager, the media folder is actually at : /home/joomla/joomla_1.5.9/images

It seems the system does not allow me to change the image and media folder out of the master directory : /home/joomla/joomla_1.5.9

What should I do to bring the media and images folder back to the deployed directory?

Many thanks.

Seth

First ensure that you are using the JMS 1.1.17 that fix a problem in the administration to allow using the deployed directory for the administration instead of the master directory.
This version allow tools like the media manager to access the deployed directory.
With previous JMS version (

Thank you. I downloaded the latest version and it works.

I see we can specify the image and media folder setting in "Website template Details"->"Folders & Files".

However, if I create the slave site manually, not from a website template, I cannot find any such setting on the "Site Details" page.

Did I miss anything?

This is only available when you select a website template or when you give a new table prefix to create the new slave site DB (without using the fresh Joomla Installation).
I remember you that those parameters are saved into the DB and is accessible from Global Configuration.
If there is no replication, JMS does not provide you those parameters as it can not save them during the website creation (no DB present - no table prefix).
